

Final Evaluation Project – End-to-End Permit Automation

Overview

Over the course of the internship, each of you has built a key component of the Arch AI platform. The final project brings everything together into a single end-to-end experience.

Each intern will be assigned a unique residential property address within the City of Redmond, Bellevue, or Kirkland. Using the software built by the team, you will generate a complete permit package—from feasibility analysis through permit-ready documentation.

This challenge will take place between 15th July 9 AM to 18th July 9 AM and is designed to evaluate not only the quality of your own work, but also your ability to collaborate, improve a shared platform, and deliver a production-quality solution.

All submissions will be shared with an external architect to gather feedback on designs. All the feedback will be shared to interns for enhancing the learning opportunity.

Teams

- G1 AADI GWALIORKAR
 HARSHIT GROVER
 DEVLANK KOU
 KAVYA PARAS SHAH

- G2 MEHTA PREM
 OJAS CHANDRASHEKHAR MARATHE
 SWARA WANKHEDE
 Prasad Gunjkar

- G3 BHAVSAR DEVAM JATIN
 Nitesh Kumar Varma
 SAKSHAM GARG
 Dhwani Bandi

- G4 BHAVYA RAKESH SHAH
 ROHAN KAPOOR .
 SHREYAS GUPTA
 Aayush Aggarwal

Triyansh Agrawal

G5 SIDAKBIR SINGH BAINS
 SIDDH KUMAR JAIN
 Marjit Dasgupta

G2	12927 NE 101st PL Kirkland 98033	CAD based  CAD - G2
G3	7000 143rd PL NE Redmond 98052	CAD based  CAD - G3
G4	12421 NE 65th Pl, Kirkland, WA 98033	No CAD. Use information on internet
G5	1626 98th Ave NE, Bellevue, WA 98004	No CAD. Use information on internet

Challenge Deliverables

For your assigned property, your submission should include:

- * Feasibility analysis of the site
- * All required permit information generated by the platform
- * High-quality architectural drawings
- * Complete permit-ready PDF package
- * End-to-end demonstration of the workflow using the integrated Arch AI platform (video)
- * Documentation of assumptions, constraints, and edge cases encountered
- * Performance metrics such as runtime, reliability, and failure handling
- * System logs or debugging insights demonstrating system behavior
- * Description of any manual interventions required and justification
- * Validation checks or QA processes used to ensure output accuracy
- * Clear documentation of improvements made to other systems in the platform, including specific changes, their impact, and how they enhanced overall product performance or usability

Your solution should demonstrate that the platform can successfully automate the permit generation process for a real-world property.

Evaluation Criteria

1. Core Ownership

Each intern owns a core component of the Arch AI platform. The primary evaluation will focus on how well you delivered your assigned ownership area.

Evaluation will consider:

1. **Complexity** – The technical difficulty and challenges involved in the assigned problem statement.
2. **Volume** – The amount of work completed within the assigned scope, including features delivered and overall implementation progress.
3. **Quality** – Quality of the solution as evaluated through peer reviews, mentor reviews, and architect reviews, including code quality, design, maintainability, reliability, and documentation.
4. **Timeliness** – Ability to deliver milestones and final implementation within the expected timelines.

2. Platform Contribution & Collaboration

Great software is built as a team. Each intern is expected to actively evaluate, improve, and strengthen the work of fellow interns.

Evaluation will consider:

- * Quality of peer reviews and feedback
- * Number and quality of contributions to other interns' codebases
- * Features, bug fixes, and enhancements submitted across the shared platform
- * Ability to improve overall system quality rather than only individual components
- * Technical collaboration and engineering best practices
- * Clarity and usefulness of documentation contributed to shared systems
- * Responsiveness to feedback and iteration speed

Helping others succeed is an important part of your final evaluation.

3. End-to-End Permit Demonstration

Each intern must successfully demonstrate:

- * Property analysis
- * Feasibility assessment
- * Complete permit workflow
- * Generation of all required permit documents

- * Final PDF output
- * Error handling and recovery mechanisms
- * System robustness across different property conditions

The workflow should execute reliably with minimal manual intervention.

4. Quality of Generated Output

The generated architectural package will be evaluated on:

- * Drawing quality and completeness
- * Accuracy of permit documentation
- * Level of architectural detail
- * Professional presentation
- * Overall usability of the generated package
- * Compliance with local zoning and permitting requirements
- * Consistency across all generated documents

The expectation is that the output closely resembles documentation that could be submitted as part of a real permitting process.

Peer, Mentor and Architect Evaluation

Every intern will evaluate every major component built by other team members, and mentors will provide additional assessment of each intern's performance.

Peer feedback should include:

- * Strengths
- * Areas for improvement
- * Bugs discovered
- * Feature recommendations
- * Overall usability
- * Code quality
- * Integration challenges and compatibility issues

Mentor evaluation will consider:

- * Technical depth and problem-solving ability
- * Ownership and initiative

- * Collaboration and communication
- * Code quality and engineering discipline
- * Contribution to overall platform success
- * Ability to think systemically and anticipate scaling challenges

Constructive feedback from both peers and mentors is expected and will be incorporated into the final evaluation.

Awards & Recognition

The overall winner will receive:

- * Grading for the internship
- * Opportunity to continue productizing the Arch AI platform after the internship
- * Opportunity to co-author and present a technical paper based on the project
- * Recognition as the top-performing intern for the Arch AI program

Bonus Points

- * How intuitive and polished the end-to-end experience feels
- * Clarity of your demo and storytelling during walkthroughs
- * How quickly issues are identified and resolved during live runs
- * Thoughtfulness in handling edge cases and unexpected inputs
- * Evidence of real-world thinking (not just ideal-case scenarios)
- * Cleanliness and readability of code and system structure
- * How well different components integrate without friction
- * The degree of automation versus manual patchwork
- * Confidence and clarity when explaining technical decisions
- * Overall product mindset rather than just feature completion

These signals often differentiate strong submissions from exceptional ones.

What Success Looks Like

The strongest submissions will demonstrate:

- * Ownership beyond individual deliverables
- * Strong engineering collaboration
- * Initiative to improve the entire platform
- * High-quality technical execution
- * Attention to detail
- * Production-ready thinking
- * Clear communication of design decisions and trade-offs
- * Robust handling of real-world variability and edge cases

Our goal is not simply to build individual features, but to create a unified AI-powered system capable of generating high-quality permit documentation for real-world residential projects.
